

# Loptex Sorter

## Tandem System

The **Tandem Sorter** is a speciality of **Loptex**.

Two autonomous systems integrated in one device.

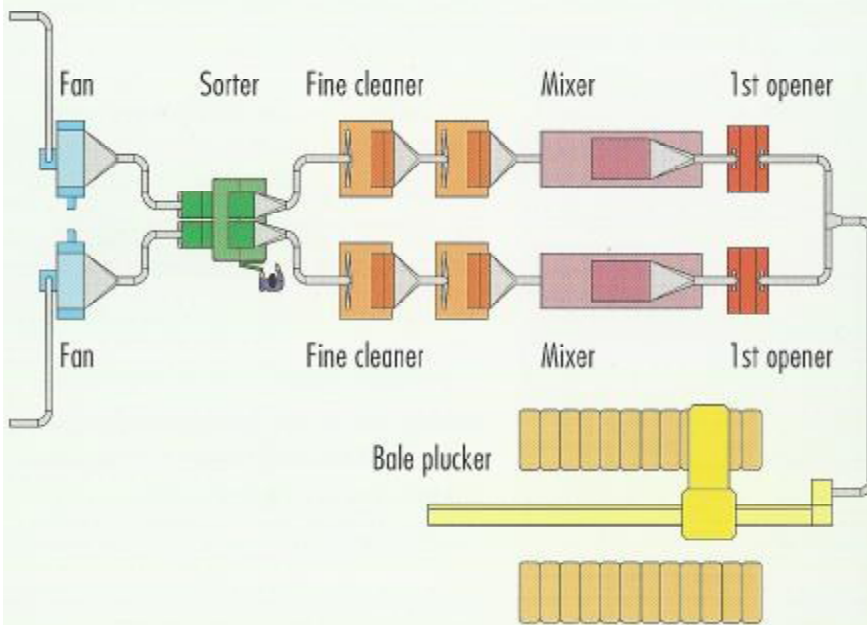

This is the cost effective solution to handle two lines.

The **Sorter** processes the photosensor signals of each line separately and activates the pneumatic valves individually.

This allows a partition of the system into two sections. Each will handle a production of up to 400 kg/h (882 lbs/hr).

Two different styles can be processed simultaneously. The average brightness of the raw material will be calculated for each section separately and the appropriate settings can be chosen individually.

**The Tandem Sorter offers  
the ideal solution where the opening line  
is split up after blending**

**Loptex**
